

13. Risks and De-Risking Plan

Risk	Why investor cares	De-risking answer
Scope sprawl	Too many apps can look unfocused.	Pitch Oscar as the OS, then choose 2 launch wedges: creator studio ops and private local AI workbench.
No revenue yet	Valuation must be justified by traction.	Use seed to create paid pilots, LOIs, proof videos, and retention metrics in 180 days.
Reliability gap	Local AI tools can fail silently.	Build evals, tool logs, crash recovery, status dashboards, and human approval gates.
Regulatory exposure	Casino and AI claims can create risk.	Keep casino play-money/demo until licensed/compliant; avoid claims of autonomous self-repair or live weight learning.
Ultimate Bourré diligence	Trademark/rules claims must survive investor review.	Term sheet is now on file; add trademark serial/registration, owner entity, rule ownership memo, redacted SCCG summary, and counsel-reviewed use boundaries.
IP and data room	Investors need ownership clarity.	Create IP inventory, repo map, asset chain-of-custody, third-party license review, and demo-safe media pack.

14. Market Context and Source Notes

Current public and private SaaS multiples are compressed versus 2021, but AI-native and specialized tools can still earn premium positioning when they show real workflow depth, retention, data defensibility, and operating quality.

Important note: fundraising discussion draft only; not legal, tax, investment, securities, gambling, or compliance advice. Review with counsel before outside investor use.
