

7. Readiness Snapshot

Current Readiness

Investor framing assumes the ecosystem is 65-70% demo-ready, with polish and diligence still ahead.

Investor takeaway: sell the progress, then show a specific funded path from demo-ready to pilot-ready.

Readiness area	Current read	Investor interpretation
Demo readiness	65-70%	Strong enough to pitch, show, and narrate with proof videos.
Sellable v1	45-55%	Needs onboarding, reliability, packaging, and customer-facing polish.
Investor diligence	35-45%	Needs data room, metrics, IP map, risk register, and pilot LOIs.
Codex-level polish	20-30%	A long-term benchmark, not the near-term fundraising requirement.

8. Moat and Defensibility

- Local-first privacy posture: private files and workflows stay on the owner's machine unless deliberately exported.
- Workflow depth: Oscar is already tied to tools, launchers, computer control, local files, transcription, and vertical app lanes.
- Owned corpus and operating rules: Oscar Brain, training packs, session packets, and crew homes create a compound knowledge base.
- Owned gaming wedge: founder-reported Ultimate Bourré trademark/rule control gives the casino lane a branded IP story rather than a generic card-table pitch.
- Vertical wedges: creator rights, off-grid chat, play-money casino engagement, local AI studio ops, and watermark trust story.
- Human-in-the-loop safety: Tool Mode and Computer Control remain owner-approved, giving investors a safer control narrative.
