

OSCAR + GOAT ROYALTY

Investor EPK, Valuation Thesis, ROI Model, and Seed-Ready Product Brief

Prepared for Life Imitates Art Inc. / DJ Speedy investor discussions

Headline investor position

Current stage: approximately 67% complete toward an institutional seed-ready v1. Suggested pitch anchor: \$22M pre-money with an acceptable negotiation band of \$12M-\$25M today and a stretch path to \$30M-\$45M after live pilots, security hardening, and revenue proof.

Important: this is an investor-pitch valuation model, not a formal appraisal, tax opinion, securities recommendation, or legal opinion. Real-money casino, banking, crypto, and payout features must remain compliance-gated until counsel, licensing, KYC/AML, geofencing, custody, and responsible-gaming controls are complete.

1. Executive Snapshot

Oscar is best positioned as a locally controlled, human-in-the-loop AI operating system for creative businesses: a studio agent, a royalty/commercial app, a media/tool platform, and a deployable local/server package that can run across Mac, Ubuntu, Thor/Threadripper, and future workstation nodes.

Metric	Current investor-ready statement
Build status	Approximately 67% complete toward a seed-ready v1; strong prototype/package depth, with compliance, QA, and pilot revenue still ahead.
Core valuation anchor	\$22M pre-money target for a \$3.5M seed raise; acceptable today range: \$12M-\$25M depending on demo stability, investor appetite, and legal diligence.
Product footprint	155 HTML app screens plus 94 JS/CSS files in the portable GOAT web app bundle; packaged Ubuntu deploy artifacts are 1.6-1.7GB each.
Agent stack	Oscar add-on, AGENT-007, Money Penny, Lexicon Lexi, Sir Codex, Ms Vanessa, Ms Nexus, local chat/tools bridges, self-healing launchers, model-drive pickers, and server deploy tools.
Model strategy	53-model local catalog with no-login/no-API Ollama lanes, six installed/custom local models observed in the packaged manifest, and a final-home target built around Threadripper + dual RTX 5090 hardware.
Commercial angle	Creative AI, royalty recovery, local/private agents, media automation, app-store-like tool access, compliance-gated casino/social entertainment, and studio operations.

Live GOAT Royalty home screenshot from the active app audit folder.

PRODUCT INVENTORY

2. What Has Been Built

The strongest investor story is not that Oscar is one chatbot. The stronger story is a system of specialized agents and human tools: a local AI crew, a creative/royalty app, a packaged server deploy, a training corpus, and a repeatable clone/install pattern for studio computers.

Module	Investor-facing capability	Current state
Oscar core	Portable studio agent with GOAT upgrade add-on, own identity, chat/tools bridge, model-source picker, and Thor endpoint option.	Prototype/installable; Oscar upgrade tools created and backed up target folders.
GOAT Royalty App	Human + AI tool platform for royalties, music business, studio operations, media, vault, agents, app launchers, banking-adjacent workflows, video, 3D, and demos.	Large portable static app bundle; current source tree shows 155 HTML pages.
AGENT-007 / crew layer	Coordinator agent with named crew homes and identity boundaries for Money Penny, Lexi, Sir Codex, Ms Vanessa, Ms Nexus, and AGENT-007.	Documented crew manifest with separate launcher/home concepts.
Local LLM lane	No-login/no-API local Ollama catalog, model-drive picker, shared model stores, and final-home scaling plan.	Catalog and installer manifests exist; full downloads remain hardware/time dependent.
Self-healing ops	Launchers, repair scripts, visibility fixes, security audit SOP, server verify tools, storage linking, and local-only bind rules.	Several scripts and SOPs exist; needs consolidated QA automation.
GOAT Casino	Stake-style original casino/game surface with GOAT Royalty branding and a compliance-gated real-money switch concept.	Prototype/demo only; real-money mode should remain off until legal and regulated operations are complete.
Creative studio tools	Pro Tools/FL/Logic training packets, music production guides, AI video pages, 3D studio pages, media lab, voice/audio lanes.	Prototype app pages and training docs exist; deep DAW automation is still human-supervised.
Server deployment	Ubuntu package for public GOAT UI plus private AGENT-007 bridge behind Nginx/auth with storage link scripts.	Packaged tarballs exist; production hardening and live verification are next gates.

Visual asset sheet assembled from the GOAT/Oscar app screenshots and generated project media.

3. Valuation Model

The right investor framing is a staged valuation, not one magic number. Oscar is already beyond a blank idea, but it is not yet a fully audited SaaS company with recurring revenue. The valuation should reward the built asset while leaving room for investors to price execution risk.

Scenario	Pre-money range	Why it fits
Conservative asset/prototype floor	\$8M-\$12M	Appropriate if investors value it as a promising but unproven prototype with limited revenue proof and remaining legal/security work.
Recommended seed ask today	\$18M-\$25M	Best anchor for a serious AI/creative investor: working app surface, agent stack, local model plan, server package, training corpus, and strong founder/product vision.
Milestone stretch	\$30M-\$45M	Reasonable only after stable server demo, clean onboarding, pilot users, compliance plan, model downloads verified, and one or more revenue/pilot signals.

Recommended term posture

Open investor discussions at a \$22M pre-money valuation with a \$3.5M seed raise. That creates a \$25.5M post-money and sells about 13.7% before any option pool or SAFE conversion mechanics. If an investor pushes hard, defend a \$14M-\$18M floor by pointing to the built package, app footprint, local model strategy, and creative/royalty vertical focus.

Component	Illustrative replacement-cost value
GOAT app + UI surface	\$350K-\$900K
Agent runtime, launchers, repair tools, local/server packaging	\$300K-\$750K
Training corpus, studio workflows, crew identity architecture	\$200K-\$500K
Graphics/media/concept development and demo content	\$150K-\$400K
Security, storage, deploy, model-pack documentation	\$150K-\$350K
Total technical/IP replacement-cost floor	\$1.15M-\$2.9M before brand, network, and upside premium

4. ROI Story For Investors

The investor ROI case should be framed around acquisition or strategic financing scenarios: creative AI tooling, local/private AI workstations, music-business automation, governed agent infrastructure, and vertical software for entertainment operations.

Seed check	Terms assumption	Dilution-adjusted ownership	\$100M exit	\$250M exit	\$500M exit	\$1B exit
\$250K	\$22M pre / \$3.5M raise	0.59%	\$0.59M / 2.4x	\$1.47M / 5.9x	\$2.94M / 11.8x	\$5.88M / 23.5x

Seed check	Terms assumption	Dilution-adjusted ownership	\$100M exit	\$250M exit	\$500M exit	\$1B exit
\$500K	\$22M pre / \$3.5M raise	1.18%	\$1.18M / 2.4x	\$2.94M / 5.9x	\$5.88M / 11.8x	\$11.76M / 23.5x
\$1M	\$22M pre / \$3.5M raise	2.35%	\$2.35M / 2.4x	\$5.88M / 5.9x	\$11.76M / 11.8x	\$23.53M / 23.5x

Dilution note: the table assumes a seed round at \$22M pre-money and shows approximate ownership before later-round dilution. A conservative model can cut these ownership percentages by 30%-50% to account for future rounds and option pools.

Royalty recovery and crew-command concept visual for investor storytelling.

HOW CLOSE TO PERFECT

5. Completion Score

Area	Score	What is done	What must happen next
Product vision / category	85%	Clear human + AI platform thesis across creative tools, royalties, agents, and local control.	Tighten into a one-sentence customer promise and three paid use cases.
GOAT app UI surface	72%	Large app shell, many standalone screens, visual identity, casino/media/model/studio pages.	Unify navigation, QA every button, remove duplicate routes, finish responsive polish.
Oscar/agent runtime	68%	Chat/tools bridge, upgrade add-ons, local storage, model-drive picker, Thor endpoint option.	Add permission model, observability, eval harness, session recovery, and repeatable install tests.
Local LLM/model system	62%	53-model catalog and installer patterns with local/custom	Complete downloads on final hardware, run smoke

Area	Score	What is done	What must happen next
		model manifests.	generations, capture model benchmarks.
Server/deployment	58%	Ubuntu package, Nginx/systemd deploy tools, storage-link scripts, security audit SOP.	Harden auth, verify on VPS, link storage safely, build one-command deploy/rollback.
Compliance/legal/IP	40%	Owner-aware rules and security SOPs exist; casino real-money switch is intentionally gated.	Counsel review, IP assignment, trademark cleanup, KYC/AML/geofence if casino goes real-money.
Investor readiness	65%	Built assets, visuals, roadmap, valuation story, and EPK now packaged.	Live demo script, pilot LOIs, data room, cap table, budget, and legal diligence packet.
Overall	67%	Strong working prototype and platform package.	Next milestone: 85% investor-ready v1 in 90-120 days with focused QA, demo, and compliance cleanup.

WHY THIS CAN WIN

6. Architecture Advantage

The market is moving toward agentic systems, but governance and deployment verification are the bottlenecks. Oscar's edge is that it is already designed around owner approval, local storage, named agent identities, offline-capable workflows, and human-facing tools instead of invisible backend autonomy.

Advantage	Investor meaning
Local-first control	Appeals to studios, creators, labels, and rights holders who do not want every file or prompt leaving the room.
Human and AI share the same app	GOAT Royalty is positioned as a tool bench for people and agents, not a separate chatbot bolted onto a product.
Agent identities and lanes	Crew homes create accountable specialization: business, engineering, verification, routing, docs, and coordination.
Self-healing and storage awareness	Repair tools, model-drive pickers, and WD/server storage planning reduce field-support friction.
Creative vertical data	Music, royalties, Pro Tools/FL/Logic notes, media, catalog, and release workflows create a sharper vertical wedge than a generic AI assistant.
Compliance-gated high-upside modules	Casino, banking, crypto, payments, and royalty payouts can be demoeo as controlled surfaces until legal gates are cleared.

Money Penny concept visual: royalty analytics, rights, licensing, and business operations.

SEED DEPLOYMENT

7. Use Of Funds

Use	Allocation	90-180 day outcome
Core product QA + UX	30%	One clean GOAT app shell, tested navigation, finished casino/demo mode, mobile polish, and a repeatable demo path.
Agent runtime + local models	22%	Oscar/AGENT-007 installer, model smoke tests, permissions, logs, self-healing, and Thor/Threadripper deployment.
Server, storage, security	15%	Hardened Ubuntu deployment, private AGENT route, WD/cloud storage sync strategy, audit reports, backup/rollback.
Compliance + IP	13%	IP assignment packet, privacy/security terms, licensing review, casino gating plan, KYC/AML/geofence requirements if activated.
Pilot sales + partnerships	12%	3-5 creator/studio pilots, investor demos, case studies, LOIs, partner outreach.
Operations reserve	8%	Accounting, insurance, legal admin, contingency, device replacements, cloud/runtime bills.

Raise target

\$3.5M seed on a \$22M pre-money anchor is the clean current ask. A smaller \$1.5M-\$2M bridge can work if it is milestone-based, but it should avoid undervaluing the platform before the polished demo and pilot proof are complete.

8. Risk Register

Risk	Answer in the room	Mitigation
Too many features	The platform is broad, but the investor wedge is creative AI operations + royalty recovery + local agent control.	Lead with three paid workflows: royalty/catalog ops, studio AI assistant, local model/media workstation.
Casino compliance	Real-money gambling is not active for public use and must stay switched off until licenses and controls are verified.	Maintain demo mode, counsel review, KYC/AML, geofencing, responsible-gaming, custody/payment controls.
AI governance	The product already uses owner approval rules and named agent boundaries.	Add audit logs, permission scopes, evals, and human sign-off checkpoints.
IP/trademark issues	Use original GOAT Royalty visuals and avoid third-party-branded concept art in investor materials.	Run a trademark/art review and keep an asset provenance register.
Model licensing	Local model catalog is a deployment lane, not a blanket commercial license claim.	Review model cards before redistribution or client delivery.
Security	Security SOP and audit tools exist, but deployment must be hardened before production exposure.	Local-only bridge by default, Nginx auth, UFW, least-privilege storage, no secrets in public packages.
Revenue proof	The built system is pre-scale; valuation requires execution milestones.	Turn pilots into LOIs, paid studio retainers, or usage-based contracts.

GOAT secure preview: investor appendix visual for governance, privacy, and controls.

MEETING FLOW

9. Investor Pitch Script

Open with this:

Thirty-second pitch

Oscar plus GOAT Royalty is a local-first AI operating platform for creative businesses. It gives studios and creators a private AI crew, royalty/commercial tools, media and production apps, local model control, and a server deployment path. The system is about 67% complete: enough is built to show the platform, but the seed round funds QA, hardening, pilots, compliance, and scale.

Slide / section	Message
Problem	Creators lose time, royalties, rights clarity, and production leverage because their tools, files, AI helpers, and business systems are scattered.
Solution	GOAT Royalty unifies human tools and AI tools in one platform; Oscar/AGENT-007 operate as local crew intelligence with approval gates.
Why now	Creative AI is commercializing, agentic AI is moving into work, and privacy/governance gaps make local-first deployment valuable.
Proof	Show the GOAT app, crew homes, server package, local model catalog, training corpus, and the Oscar add-on flow.
Business model	Studio/creator subscriptions, enterprise creative ops, setup fees, local workstation deployments, royalty-recovery services, marketplace/app modules, and compliance-gated gaming/social entertainment.
Ask	\$3.5M seed at a \$22M pre-money anchor to reach investor-ready v1, pilots, and compliance-clean launch posture.

NEXT 120 DAYS

10. Milestone Roadmap

Time	Milestone	Investor proof
0-30 days	Freeze source-of-truth app path, finish navigation QA, clean demo routes, add visible versioning.	Demo no longer depends on developer explanation.
30-60 days	Harden server deployment, private bridge auth, storage link, backup/rollback, security report.	VPS demo can be shown safely with public UI and private agent routes.
45-75 days	Run local model smoke tests on final hardware and capture benchmark sheet.	LLM catalog moves from promise to measured capability.
60-90 days	Pilot two to three creator/studio workflows: royalty report, session assistant, media/video package.	Case-study proof, screenshots, owner quotes, potential LOIs.
90-120 days	Compliance packet, IP register, data room, investor deck, live demo script, financial model.	Ready for priced seed or lead investor negotiation.

Private vault visual: data-room, API vault, and secure deploy positioning.

WHAT TO SHOW PARTNERS

11. Data Room Checklist

Folder	Contents
Product demo	GOAT app URL/path, screenshots, demo script, app map, casino demo-mode statement.
Technology	Source manifest, server package manifest, installer scripts, model-pack manifest, security SOP.
IP and brand	Original assets, logo/brand files, trademark search notes, copyright/assignment drafts.
Business	Valuation model, use of funds, pilot plan, customer personas, pricing, ROI cases.
Compliance	Privacy/security posture, AI governance, casino gating, payments/banking controls, counsel tasks.
Operations	Device map, WD/cloud storage plan, VPS details, backup/restore checklist, QA checklist.

GOAT Casino tightening preview

GOAT Casino Tightening Preview

Local GOAT floor + Raspy Ultimate Bourre structure = premium GOAT Casino OS

LOCAL GOAT BUILD

GOAT Royalty Casino

7 playable prototype games, GOAT Originals shelf, VIP wallet, Casino Night pass, fairness shell, real-money gate.

Needs cleaner app-shell, stronger cashier/admin rhythm, less scattered presentation.

RASPY LIVE BUILD

Ultimate Bourre Casino

Cleaner app-shell, account/sidebar, cashier/admin panels, Ultimate Bourre room, VIP access, Oscar tools, compliance grid.

Live route is currently unreachable from this Mac because DNS/network is down.

MERGED TARGET

Premium GOAT Casino OS

Use Raspy seriousness with GOAT-branded games, Money Penny hosting, AGENT-007 risk lane, wallet rails, and legal locks.

Fun Play stays default. Real mode stays owner-gated until legal/KYC/AML/wallet approval.

Open locally: `OPEN GOAT CASINO NIGHT.command`
`goat-royalty-portable-2.0.0/web-app/goat-casino.html`

Audit after tightening: 0 missing refs, 0 dead buttons, 0 JS syntax errors.

This page shows the decision: keep the local GOAT game floor, borrow the cleaner Raspy operator structure, and merge both into a premium GOAT Casino OS while real-money mode stays locked.

GOAT Royalty Casino - what is already in the app

Playable floor

Seven prototype games: Crown Slots, Royal Dice, GOAT Roulette, Studio Blackjack, Royal Plinko, Crown Crash, and Crew High Card.

GOAT systems

VIP wallet, status ladder, session ledger, live wins, leaderboard, Casino Night pass, reward wall, GS1/ISRC reward rails, and creator tie-ins.

Safety posture

Fun Play is active by default. Real deposits, withdrawals, cash prizes, and crypto wagering remain gated behind legal, wallet, security, KYC/AML, and owner approval.

Tightening applied

Added a local-vs-Raspy comparison board, premium merge target, stronger operator copy, upgraded game-card badges, cleaner glass panels, and responsive rules.

Source: /Volumes/i2i 1/Agent-007-GOAT/goat-royalty-portable-2.0.0/web-app/goat-casino.html

Styles: /Volumes/i2i 1/Agent-007-GOAT/goat-royalty-portable-2.0.0/web-app/css/goat-casino.css

Ultimate Bourre Casino - what it contributes

Saved live title

Ultimate Bourre Casino

Better structure

The saved Raspy page has a serious app-shell layout, casino sidebar, account panel, cashier/banking section, VIP access section, Oscar tools, and compliance grid.

What to reuse

Use the account/sidebar, cashier rhythm, Oscar ops tools, compliance grid, and Ultimate Bourre room structure as the operator-facing layer.

Current blocker

The live Raspy URL could not be re-opened from this Mac session because DNS/network is currently unavailable. The saved HTML snapshot was used for this appendix.

Premium GOAT Casino OS roadmap

Front room

GOAT-branded lobby with Money Penny hosting, AGENT-007 risk lane, Master Oscar classic pit, GOAT Originals, VIP status, and private event passes.

Operator core

Cashier, banking, wallet firewall, fairness engine, risk desk, compliance kernel, audit logs, responsible controls, and owner approval lane.

Real-money gate

Keep Fun Play as the default. Real money only activates after licensing, jurisdiction checks, KYC/AML, custody/payout controls, security review, and written owner approval.

Investor message

This is not a throwaway casino page. It is an entertainment and VIP retention layer on top of the GOAT Royalty app's wallet, legal, creator, and AI-agent infrastructure.

What needs to happen before deploy

1. Restore network path

Fix the Mac DNS/network state or get the Raspy local IP/hostname so the live casino can be opened and compared directly.

2. Sync the merge

Push the tightened local GOAT casino HTML/CSS to the Ubuntu server after the active deployment lane is reachable.

3. Add visual capture

Capture live screenshots of both local and Raspy casino pages once reachable, then replace the saved-summary page with live screenshots.

4. Keep compliance locked

Do not enable deposits, withdrawals, crypto wagering, or cash prizes until counsel, licensing, KYC/AML, wallet custody, and audit controls are complete.

Latest local audit after tightening: 157 pages, 84 JS files, 13 CSS files, 0 missing references, 0 dead buttons, 0 JS syntax errors.
